

**Power-Stud™** *Wedge Expansion Anchor*  
*Mechanically Galvanized and Stainless Steel Versions*

**PRODUCT DESCRIPTION**

The Power-Stud anchor, is a fully threaded, torque-controlled, wedge expansion anchor. It is available in a threaded version suitable for applications in solid concrete and grout-filled concrete masonry. The threaded version is produced in mechanically galvanized carbon steel and stainless steel to offer various levels of corrosion resistance depending on use.

**GENERAL APPLICATIONS AND USES**

- Lighting Standards and Base Plates
- Sills and Support Ledgers
- Retrofit Projects and Machinery Anchorage
- Food and Beverage Facilities
- Water Treatment Plants and Marine Applications

**FEATURES AND BENEFITS**

- + Fully threaded, medium duty all-purpose anchor
- + Length ID stamped on each threaded anchor
- + Anchors can be installed through the fixture for hole spotting not required
- + Chamfered impact section prevents damage to threads
- + Clip design prevents spinning during installation
- + Nominal drill bit diameter same as anchor diameter

**APPROVALS AND LISTINGS**

Tested in accordance with ASTM E488 and AC01 criteria  
 FM Global (Factory Mutual) – File No. J.I. OK3A9.AH (see ordering information)  
 Underwriters Laboratory (UL Listed) – File No. EX1289 (see ordering information)  
 Federal GSA Specification  
 Meets the descriptive and proof load requirements of CID A-A-1923A, Type 4

**GUIDE SPECIFICATIONS**

**CSI Divisions:** *03151-Concrete Anchoring, 04081-Masonry Anchorage and 05090-Metal Fastenings.* Expansion Anchors shall be Power-Stud as supplied by Powers Fasteners, Inc., Brewster, NY.

**Nomenclature**

- d* = Diameter of anchor
- d<sub>bit</sub>* = Diameter of drill bit
- d<sub>h</sub>* = Diameter of fixture clearance hole
- d<sub>w</sub>* = Diameter of washer
- h* = Base material thickness.  
The minimum value of *h* should be 1.5*h<sub>v</sub>*, or 3" whichever is greater
- h<sub>v</sub>* = Minimum embedment depth
- l* = Overall length of anchor
- t* = Fixture thickness

**INSTALLATION PROCEDURES**

**Threaded Stud Version**

Using the proper diameter bit, drill a hole into the base material to a depth of at least 1/2" or one anchor diameter deeper than the embedment required. The tolerances of the drill bit used must meet the requirements of ANSI Standard B212.15

Blow the hole clean of dust and other material. Do not expand the anchor prior to installation

Position the washer on the anchor and thread on the nut. Drive the anchor through the fixture into the anchor hole until the nut and washer are firmly seated against the fixture. Be sure the anchor is driven to the required embedment depth

Tighten the anchor by turning the nut 3 to 5 turns past finger tight or by applying the guide installation torque from the finger tight position.

**MATERIAL SPECIFICATIONS**

Anchor Component	Mechanically Galvanized Carbon Steel Power-Stud
Anchor Body	AISI 1018 (1/2" – 3/4", lengths up to 7")
	AISI 12L14 (7/8" – 1" and all lengths over 7")
Nut	Carbon Steel, ASTM A563, Grade A
Washer	AISI 1010 Carbon Steel, Meets Dimensional Requirements of ANSI/ASME 18.22.1, Type A Plain
Expansion Wedge	Type 304 Stainless Steel
Zinc Plating	ASTM B695, Class 65, Type I

1. Tabulated load values are for anchors installed in concrete. Concrete compressive strength must be at the specified minimum at the time of installation.

2. Ultimate load capacities must be reduced by a minimum safety factor of 4.0 or greater to determine allowable working load. Consideration of safety factors of 10 or higher may be necessary depending upon the application such as life safety or overhead.

1. Allowable load capacities listed are calculated using and applied safety factor of 4.0. Consideration of safety factors of 10 or higher may be necessary depending upon the application such as life safety or overhead.
2. Allowable load capacities are multiplied by reduction factors found in the Design Criteria section when anchor spacing or edge distances are less than critical distances.
3. Linear interpolation may be used to determine allowable loads for intermediate embedments and compressive strengths.

1. Allowable load capacities listed are calculated using and applied safety factor of 4.0. Consideration of safety factors of 10 or higher may be necessary depending upon the application such as life safety or overhead.
2. Allowable load capacities are multiplied by reduction factors found in the Design Criteria section when anchor spacing or edge distances are less than critical distances.
3. Linear interpolation may be used to determine allowable loads for intermediate embedments and compressive strengths.

3. Tabulated load values are for anchors installed in the center of the flute. Spacing distances shall be in accordance with the spacing table for lightweight concrete listed in the Design Criteria section. Linear interpolation may be used for flute edge distances between those listed. Flute edge distance equals one-half the minimum deck width.
4. Anchors are permitted to be installed in the lower or upper flute of the metal deck provided the proper installation procedures are maintained.

1. Tabulated load values are for anchors installed in minimum 6-inch wide, Grade N, Type II, medium and normal-weight concrete masonry units conforming to ASTM C 90 that have reached the minimum designated ultimate compressive strength at the time of installation (*f'<sub>m</sub>* ≥ 1,500 psi).
2. Allowable load capacities listed are calculated using an applied safety factor of 5.0. Consideration of safety factors of 10 or higher may be necessary depending on the application, such as life safety or overhead.
3. The tabulated values are for anchors installed at a minimum of 12 anchor diameters on center for 100 percent capacity. Spacing distances may be reduced to 6 anchor diameters on center provided the capacities are reduced by 50 percent. Linear interpolation may be used for intermediate spacing.

**DESIGN CRITERIA (ALLOWABLE STRESS DESIGN)**

**Combined Loading**

For anchors loaded in both shear and tension, the combination of loads should be proportioned as follows:

$$\left(\frac{N_u}{N_n}\right)^{\frac{5}{3}} + \left(\frac{V_u}{V_n}\right)^{\frac{5}{3}} \leq 1 \quad \text{OR} \quad \left(\frac{N_u}{N_n}\right) + \left(\frac{V_u}{V_n}\right) \leq 1$$

Where: *N<sub>u</sub>* = Applied Service Tension Load  
*N<sub>n</sub>* = Allowable Tension Load  
*V<sub>u</sub>* = Applied Service Shear Load  
*V<sub>n</sub>* = Allowable Shear Load

1. Allowable load values found in the performance data tables are multiplied by reduction factors when anchor spacing or edge distances are less than critical distances. Linear interpolation is allowed for intermediate anchor spacing and edge distances between critical and minimum distances. When an anchor is affected by both reduced spacing and edge distance, the spacing and edge reduction factors must be combined (multiplied). Multiple reduction factors for anchor spacing and edge distance may be required depending on the anchor group configuration.

Notes: Critical spacing ( $s_{cr}$ ) is equal to 2 embedment depths ( $2h_v$ ) at which the anchor achieves 100% of load.

Minimum spacing ( $s_{min}$ ) is equal to 1 embedment depth ( $h_v$ ) at which the anchor achieves 50% of load.

The published length is the overall length of the anchor. Allow for fixture thickness plus one anchor diameter for the nut and washer thickness when selecting a length.
